

# Research volunteers sought.

Our research project is investigating the cause of drooling, a symptom experienced by some people with Parkinson's.

We are recording swallowing of saliva, using a coin-sized microphone taped onto the neck.

✓We have collected data from people **with Parkinson's**.

Now, we need matching data from people without Parkinson's who do not experience drooling

We are looking for up to twelve volunteers.

Women born between:  
1962 - 1966  
1936 - 1941  
1938 - 1943 x 2

Men born between:  
1954 - 1958 x 2  
1939 - 1943 x 2

Participation involves a **single visit** to Cabrini for **45 minutes**. Participants are not paid for their time. However, their help is appreciated – the research could help guide future treatment for Parkinson's.

If you might be interested in participating, please contact:
