

RESEARCH ON MOTIVATION IN PARKINSON'S DISEASE

Parkinson's disease is usually considered a disorder of movement, but many patients also suffer from problems with **thinking** and **motivation**.

At the *Turner Institute for Brain and Mental Health* at Monash University, we conduct research into the difficulties with cognition and motivation commonly faced by individuals with Parkinson's disease.

Our goal is to better understand the brain processes that lead to these problems, in order to develop better treatments for them in the future.

We would like to invite you to help us achieve this important goal by volunteering for our research. This would involve 1-2 hours of your time, during which we will ask you to complete simple tasks on a computer.

Please note that you **do not need** to be experiencing any problems with your thinking or motivation to be eligible.
